QUESTION

(UGC MATH (MATHA) JUNE 2017 Q.52)

X and Y are independent random variables each having the density

$$f(t) = \frac{1}{\pi} \frac{1}{1+t^2} \quad -\infty < t < +\infty \quad (0.0.1)$$

Then the density function of $\frac{X+Y}{3}$ for $-\infty < t < +\infty$ is

- 1) $\frac{6}{\pi} \frac{1}{4+9t^2}$
- 2) $\frac{6}{\pi} \frac{1}{9+4t^2}$
- 3) $\frac{3}{\pi} \frac{1}{1+9t^2}$
- 4) $\frac{3}{\pi} \frac{1}{9+t^2}$

SOLUTION

Let us consider the random variables X and Y. The Characteristic function of the probability density $f(t)$ is

$$g(w) = \int_{-\infty}^{\infty} f(t) e^{iwt} dt \quad (0.0.2)$$

$$= \int_{-\infty}^{\infty} \frac{1}{\pi} \frac{1}{1+t^2} e^{iwt} dt \quad (0.0.3)$$

$$= e^{-|w|}, \quad -\infty < w < \infty \quad (0.0.4)$$

The product of the Characteristic function of probability density of X and Y is

$$h(w) = g_1(w) \times g_2(w) = e^{-2|w|} \quad (0.0.5)$$

To get the probability density of X+Y, we find the inverse characteristic function of h(w).

$$F_{X+Y}(t) = \int_{-\infty}^{\infty} h(w) e^{-iwt} dw \quad (0.0.6)$$

$$= \int_{-\infty}^{\infty} e^{-iwt-2|w|} dw \quad (0.0.7)$$

$$= \frac{4}{4+t^2}, \quad -\infty < t < \infty \quad (0.0.8)$$

But since F_{X+Y} is a probability distribution function,

$$\int_{-\infty}^{\infty} F_{X+Y}(t) dt = 1.$$

$$\text{But } \int_{-\infty}^{\infty} F_{X+Y}(t) dt = \int_{-\infty}^{\infty} \frac{4}{4+t^2} dt = 2\pi \quad (0.0.9)$$

So we plug in the normalisation factor $\frac{1}{2\pi}$ and the new F_{X+Y} becomes

$$F_{X+Y}(t) = \frac{2}{\pi} \frac{1}{4+t^2}, \quad -\infty < t < \infty \quad (0.0.10)$$

We know that if a random variable M has a probability density $f_M(x)$, then the probability density of random variable kM is

$$f_{kM}(x) = \frac{1}{|k|} f_M\left(\frac{x}{|k|}\right) \quad (0.0.11)$$

Probability density of $Z = \frac{X+Y}{3}$ given $F_{X+Y}(t)$ is

$$F_Z(t) = 3 \times f_{X+Y}(3t) \quad (0.0.12)$$

$$= \frac{6}{\pi} \frac{1}{4+9t^2} \quad (0.0.13)$$

Correct Option : 1
